
*A walkthrough of every Phase 1 feature in plain terms,
for discussion with Mejora before development begins.*

How to use this document — each feature below is described in the way it will actually work day to day, not in technical terms. Use it to confirm the scope is right, flag anything missing, and raise questions before Phase 1 development starts.

1 Service Catalogue & Pricing

Everything Mejora sells, with what it costs and how long it takes.

Service creation & categorisation

Every service Mejora offers is set up once with a name, category, price, and how long it typically takes — this becomes the single source of truth used everywhere else in the system, from booking to billing.

Add-on services

Optional extras — like a hair spa treatment added to a haircut — can be attached to a base service with their own price and time, so upsells are easy to offer and track.

Price editing & history

Prices can be updated at any time as the business decides, but past bills always keep the price that was actually charged at the time — so historical records stay accurate even after a price change.

Enable / disable a service

A seasonal or discontinued service can be hidden from the booking screen without deleting it and losing its history — useful when something comes back the following season.

2 Billing & Point of Sale

Turning a finished appointment into a paid, recorded, compliant bill.

Bill generation

Once an appointment is done, front desk generates the bill directly from it — the services and prices are already filled in, so there's no re-typing anything.

Manual line items

Sometimes a charge doesn't come from a booked appointment — a retail product, for example. These can be added straight onto a bill as needed.

Split & partial payments

Clients don't always pay one way. A single bill can be settled with part cash and part card, or however the client prefers to split it.

Payment method reconciliation

At the end of the day, totals are broken down by cash, card, and UPI, which makes closing the till and checking everything adds up straightforward.

GST-compliant bill output

Every bill includes the correct tax breakdown and a proper sequential bill number, ready to print or email to the client — no separate compliance step needed.

Refunds & adjustments

If a refund needs to be issued against a past bill, it can be done with a reason recorded — so there's always a clear trail of why money went back out.

3 Inventory & Stock Tracking

Knowing what's on the shelf, what a service actually uses, and when to reorder — from day one, not added later.

Product & consumable catalogue

Everything the studio uses or sells — colour, products, disposables — is logged with a quantity on hand, so stock levels are always visible rather than a guess.

Usage-per-service deduction

Once you tell the system roughly how much of a product a given service uses, completing that service automatically reduces stock — no manual counting required after every appointment.

Manual stock adjustment

After a physical stock count, or if something is wasted or broken, the numbers can be corrected directly so the system stays accurate.

Low-stock alerts

When something runs low, the owner gets notified automatically rather than finding out mid-service that a product has run out.

Retail sale of stock

Products can be sold directly to a client at the front desk — this reduces stock and adds the item to that client's bill in one step.

4 Appointment Booking & Calendar

The screen front desk will live in all day — every chair, every stylist, every booking in one place.

Staff / chair calendar view

Front desk gets a day and week view of the studio showing exactly who is booked, on which chair, and for what — colour-coded so a glance tells you what's booked, what's in progress, what's finished, and where a client didn't show up. This replaces the appointment register or diary currently used to track the day.

Create & edit appointments

When a client calls or walks in to book ahead, front desk picks an available staff member and time slot, selects the service(s) they want, and the system works out the duration automatically. Any special notes for that visit can be added right there.

Reschedule & cancel

Plans change — a client wants to move their appointment or cancel it. Front desk can do this in a couple of taps, and the system records why it happened (client asked, no availability, and so on), so over time you'll

have a clear picture of how often and why appointments get moved.

Walk-in queue

Not every client books ahead. A walk-in can be added to a queue and assigned to the next free stylist without needing a full appointment record — useful for busy weekend footfall.

No-show & late-cancellation handling

When someone doesn't turn up, front desk marks it as a no-show rather than just leaving it blank. If a client does this repeatedly, their profile can be flagged so staff know to expect it — useful context when taking future bookings from them.

Automated reminders

Clients get an SMS or WhatsApp reminder before their appointment automatically, with no one at the front desk needing to send it manually. A confirmation message also goes out the moment a booking is made. This alone tends to cut down no-shows significantly.

Staff time-off & blocked slots

When a stylist is on leave, taking a break, or unavailable for any reason, that time can be blocked out so the system simply won't offer it as bookable — no risk of double-booking someone who isn't actually working.

5 Bridal & On-Site Event Scheduling

Bridal and groom work is different from a regular chair booking — this is where that difference is handled.

Bridal/groom booking creation

A bridal or groom engagement usually involves two distinct appointments — a trial and the actual event day. Both get booked as one linked engagement rather than as two separate, unrelated bookings, so nothing about the client's event gets lost between the two visits.

On-location assignment

When work happens at the client's venue rather than in the studio, that booking is clearly marked as on-location with the address recorded, so it's immediately obvious on the calendar which bookings mean a stylist needs to travel.

Staff assignment for on-site work

One or more staff can be assigned specifically to travel for a bridal or groom engagement — separate from their regular in-studio schedule for that day, so there's no confusion about who's meant to be where.

Trial-day to event-day linkage

Front desk and staff can see the trial appointment and the event-day appointment together as one engagement, rather than having to piece together two separate bookings to understand the full picture for a client.

Event reminders

Both the trial and the event day get their own confirmation and reminder messages, timed appropriately for each — a bridal client is reminded about her trial separately from being reminded about her wedding day.

6 Client Profiles & History

Everything Mejora knows about a client, kept in one place instead of in someone's memory.

Client record creation

A simple profile is created the first time a client visits — name, phone number, and any family link, which is especially useful for bridal parties who book together.

Visit history

Every past appointment, service, and bill for a client is visible on their profile — helpful for front desk or a stylist wanting quick context on a returning client.

Preference & allergy notes

Free-text notes can be attached to a profile — product sensitivities, a preferred stylist, styling preferences — so that knowledge isn't lost if the usual staff member isn't available.

Bridal client event details

For a bridal client specifically, the event date, venue, and all linked bookings are visible together, so anyone at the front desk can see the full picture of that engagement at a glance.

Client search & lookup

Finding an existing client by name or phone number when booking or billing is quick, which avoids accidentally creating duplicate profiles for the same person.

7 Expense Management

So the revenue numbers reflect actual profit, not just money coming in.

Expense entry

Day-to-day costs — rent, utilities, supplies, salaries, marketing, or anything else — are logged with an amount, date, and category, giving a real picture of what it costs to run the studio.

Recurring expenses

Costs that repeat every month, like rent, can be marked as recurring so they don't need to be typed in again each time.

Receipt / attachment upload

A photo or scan of a receipt can be attached directly to an expense entry, keeping proper records without a separate filing system.

Expense categorisation & reporting

Expenses can be viewed by category and by period, and — alongside the revenue already shown on the dashboard — this gives a true net profit figure, not just top-line revenue.

8 Staff & Roster Management

Who works when, and what they're actually able to do.

Staff profile creation

Each staff member gets a profile with their basic details, role, and photo — a simple internal record rather than anything client-facing.

Skill & service tagging

Not every stylist does every service. Tagging each staff member with what they're qualified for means the booking screen only offers clients the right people for the service they've chosen.

Shift roster

Regular working hours are set per staff member, with the ability to adjust a specific day when someone's hours change — for example, coming in later on a particular date.

Leave & time-off requests

Staff can put in a request for leave, and a manager approves or rejects it. Once approved, those days are automatically blocked from being booked — no manual step required to keep the calendar accurate.

Role-based access

Not everyone should see everything. Owners, managers, and front desk each get access appropriate to their role — for instance, only an owner or manager can change pricing or see full revenue figures.

9 Owner Dashboard

How the studio is doing, at a glance, without digging through individual records.

Today's bookings overview

A quick count and list of today's appointments, walk-ins, and any cancellations — a snapshot of the day without needing to open the full calendar.

Daily & period revenue

Revenue for today, this week, and this month, broken down by how it was paid — a running read on how the business is performing without waiting for a monthly report.

Staff utilization

A view of how booked each staff member has been over a period — useful for spotting who's overloaded and who has spare capacity.

Low-stock summary

Anything running low on stock is surfaced right on the dashboard, so it's part of the daily check-in rather than something that needs a separate look.

10 Staff Commission & Incentives

Tying what staff actually performed to what they're paid for it.

Commission rate setup

A commission rate — percentage or flat amount — can be set per staff member, either across the board or by service category, matching however Mejora currently structures pay.

Automatic commission calculation

Every time a paid appointment is completed, the commission owed is worked out automatically based on that staff member's rate — no manual tallying at the end of the month.

Commission statement

A summary of services performed and commission earned over a period is available to both the owner and the staff member themselves — useful for transparency and for settling pay.

Manual incentive entries

Beyond standard commission, a one-off bonus can be added directly — for example, recognising a top performer for the month.
